

A Strategic Framework for Investing in CT's Transportation:

Economic Growth - Infrastructure Preservation – Sustainable Communities

DRAFT (2010-12-10) – for review

Connecticut is at a critical but difficult juncture regarding the future of its transportation system. We have begun to develop a multi-modal transportation network that reaches beyond the highway system. But, the cost of developing that network and preserving the existing transportation infrastructure clearly exceeds the state's current resources.

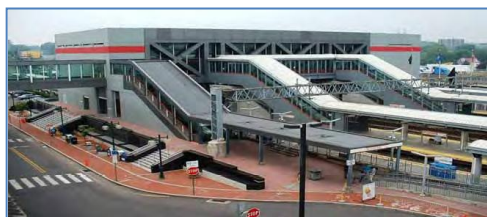

These needs do not exist in a vacuum, and how we address them can directly affect the state's quality of life, its communities, its environment, and its economy. In 1999, the Gallis report¹ warned that we need to make major improvements to our transportation system to sustain growth in our economy. That report led to the creation of the Transportation Strategy Board and many of the improvements undertaken over the past decade. But, more work remains to be done, and completing it will require more funding than is currently available.

The ongoing national recession makes it difficult to consider raising new revenues to support new or expanded transportation investment programs. While our fiscal and economic challenges seem overwhelming, a program of increased but strategic investments can yield large benefits. More importantly, the risks of not acting are even greater. Delaying action threatens Connecticut's long-term economic growth and competitiveness. Acting now allows Connecticut to build on the momentum from recent transportation investments in critical projects, the growing state and national emphasis on multi-modalism, and the changing managerial structure at DOT that is improving efficiency and responsiveness.

The State has set the stage for rapid progress on major improvements to our transportation system, if we can find the funding to continue ongoing projects and advance new projects. We are also in the midst in a major shift in our transportation planning paradigm that recognizes the importance of linking transportation planning to economic development, responsible growth, and sustainable development. Acting now will allow us to take advantage of this groundwork.

Connecticut needs to invest more in our transportation system, but to do so wisely and strategically. We need to support improvements that promote state strategic goals of economic growth, sustainable development, and improved quality of life while assuring a safe and well maintained transportation system.

¹ *Connecticut: A Strategic Economic Framework*, 1999, prepared by Michael Gallis for the CT Regional Institute for the 21st Century

Over the last year, the Transportation Strategy Board (TSB) reviewed the state of our transportation system and examined how congestion and transportation deficiencies are adversely affecting our economy. The Board also considered whether our transportation system is adequately serving the mobility needs of residents and business, and how it can support broader state goals of economic growth, sustainable development, and livable communities. This paper provides a summary of our major findings and conclusions. It also calls for increased but more strategic investments in our transportation system. The investment is required to address critical infrastructure preservation and repair needs, but more importantly it is needed to restore and sustain economic growth. It also calls for making transportation investments in a manner that supports state goals of improving quality of life, promoting responsible growth, and improving our environment.

The total cost of meeting both our basic system preservation needs and system expansion/enhancement needs is enormous. DOT estimated the cost of unfunded projects in its recent capital plan to be \$15-20 billion and take over a decade to complete. While the fiscal challenge is great, it is manageable if needs are prioritized and revenue increases are phased over time to meet the cash flow needs of a long-term capital program and schedule of projects.

The TSB recommends an approach that prioritizes projects in a way which allows the state to both keep its infrastructure in a good state of repair, and to undertake strategic system expansion or enhancement projects. The Board also recommends focusing on a 10-year timeframe and developing a program and schedule of projects that can be financed with revenues increases phased in over the 10-year time period. The proposed program consists of the following elements.

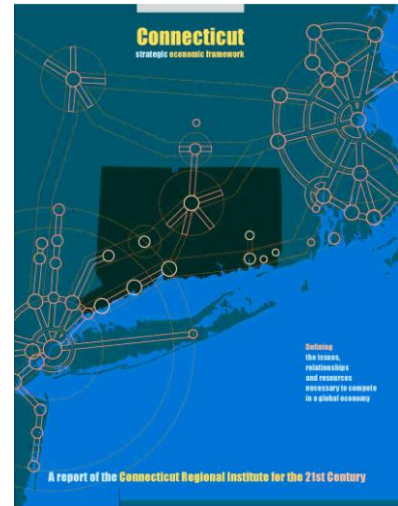

Programmatic Preservation Funds (\$1.5 billion in years 1-10)

Major Preservation Projects of Strategic Value (\$3 billion in yrs 1-10)

Major Enhancement Projects of Strategic Value (\$3 billion in yrs 1-10)

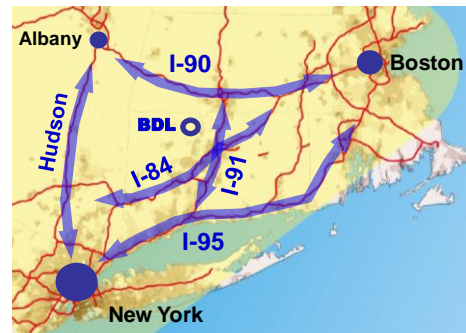

I. The Economic Costs, Risks, & Opportunities

Connecticut's economic future and its transportation future are inextricably linked. Without major improvements to important transportation linkages our economy will stagnate even as neighboring economic centers grow. With sufficient and strategically focused transportation improvements we can position the state to share in the economic growth that will eventually return to the nation, and we can realize the full benefit of being in such close proximity to the world's financial and economic center. Maintaining good access to New York is also important because it is at the center of national and global transportation networks – air (cargo and passenger), maritime (freight), and highways (including trucking). Strategic transportation investments will not guarantee economic growth, but they are necessary to support and sustain growth.

The 1999 strategic economic framework report by Gallis was not the first to note the importance of transportation for economic growth, but he did surprise many people when – as part of a study of the state's economy – he observed the degree to which transportation problems were impeding Connecticut's ability to grow its economy. He suggested that if the transportation problems were not fixed, Connecticut's economy would lag well behind that of neighboring economic power centers in New York and Boston.

Corridors: The Gallis report emphasized the importance of maintaining strong linkages to New York's economy, access to its markets, and to its national and international transportation hubs. He observed that access was weakening as congestion made transportation more difficult and costly, and as new and evolving national and global transport systems gave better access to areas west of the Hudson. Gallis identified several multi-modal transportation corridors that were of vital importance to Connecticut's economy. Three are within Connecticut:

- **I-95 (NY-RI):** Multimodal corridor that links Connecticut to NYC and is an important passenger rail link, highway link, and truck route for freight. It is defined by I-95, Merritt Parkway, New Haven rail line
- **I-84 (NY-Hfd-MA):** A highway corridor the links Connecticut to NYC and is an important truck route for freight. It is defined by I-84.
- **I-91 (New Haven-Springfield):** Multimodal corridor that serves the highly urbanized NH-Hartford-Springfield corridor and links three east-west corridors. It is defined by I-91 and NH-SPR rail line. It is also home to the Port of New Haven, which supplies much of the petroleum used in Connecticut.

Hub: Bradley Airport. Gallis also identified one critical transportation hub in Connecticut: Bradley Airport. Bradley is much more than a transportation facility. It is an important facilitator of economic growth. The 1999 Gallis report recognized this, but a 2005 study by the CT Department of Economic and Community Development clearly defined Bradley's value as an

BRADLEY AIRPORT
Engine of
Economic Growth

economic engine. The study estimated that over a 20-year period, the airport would create over 140,000 jobs and \$34 billion in economic output. It would also generate over \$11 billion in additional income for residents.²

Airports create this value by acting as facilitators that provide faster, more convenient, and better access to national and international markets and economic centers. This benefits business travel, tourism, and transport of high value, low bulk products. It is especially valuable to many of the high tech, medical, research, and educational firms and institutions located in Connecticut, but especially those in the I-91 or Knowledge Corridor.

\$34 Billion added
to state economy

'It is as an economic facilitator that an airport truly impacts an economy. As an economic facilitator airports allow other "economic entities" to create more economic activity than they otherwise could create without their presence. It is the value of the access that is provided by the presence of the airport that has the greatest and most far-reaching influence on an economy.'
The Contribution of Bradley International Airport to Connecticut's Economy, 2005, CT DECD

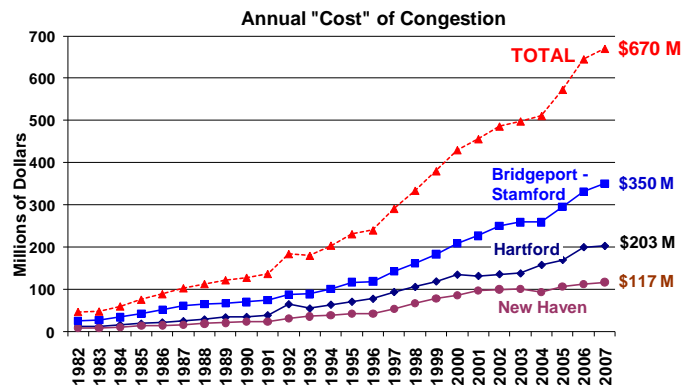

The Cost of Congestion (over \$670 million annually)

The 1999 strategic economic framework report raised concerns about the growth of congestion. Congestion reduces the ability of Connecticut's major transportation corridors to provide effective access to New York and their ability to support economic activity within the state. High levels of congestion are reducing access to New York and increasing the cost of interacting with New York.

Congestion impacts virtually every urban area in Connecticut, but it is particularly severe in the Bridgeport-Stamford area. It is also a serious problem in the Hartford and New Haven areas, and a regular occurrence in the Danbury, Waterbury, and New London areas. The Urban Mobility Report (UMR) estimates that congestion causes over **32 million hours of delay** annually in our three largest urban areas. A daily problem that can range from an inconvenience to a major impediment to travel, congestion imposes a enormous cost on state residents and businesses. A conservative estimate is that the **annual cost of congestion exceeds \$670 million**; the actual cost is probably much higher.

32 million hours
of delay annually

The estimate of \$670 million should be viewed as a very conservative estimate. It is based on the Urban Mobility Report (UMR), which is a national program that has tracked congestion costs for metropolitan areas for over 20 years.³ It does not include smaller urban areas such as Danbury, Waterbury, and New London. It uses assumptions and national averages that do not reflect the higher wage rates in Connecticut or the fact the congestion in Connecticut often extends beyond the traditional morning and afternoon peak periods. A study conducted for the Southwestern CT RPA, found that when local wages rates are used and a more complete accounting of congestion is done, congestion costs in Southwestern CT far exceed the costs suggested by the UMR study.⁴

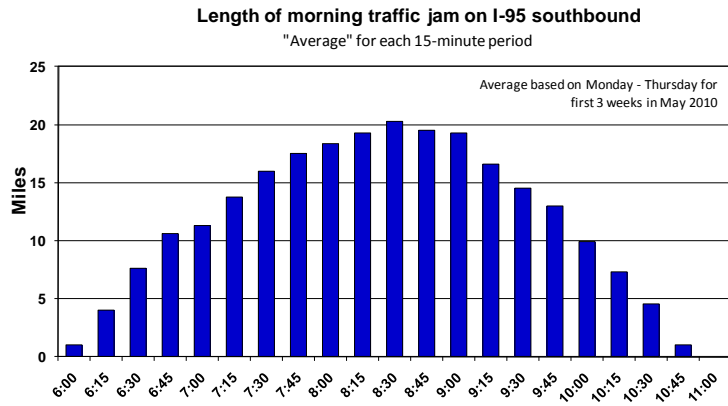

² The Contribution of Bradley International Airport to Connecticut's Economy, 2005, CT DECD

³ Urban Mobility Report, 2009, Texas Transportation Institute

⁴ Measuring the Costs of Congestion: SWRPA Region & Westchester County, 2010, prepared by Urbanomics for South Western Regional Planning Agency & Westchester county Dept. of Planning.

To fully appreciate the potential impact on businesses, you need to consider the duration as well as the extent and severity of congestion in the I-95 corridor. Congestion has become pervasive and affects much of the corridor over an extended portion of the day. Planning deliveries and travel to meetings requires building in lots of extra travel time, or taking advantages of relatively small windows of opportunity during the day when congestion is normally absent. As seen in Figure xx, traffic back-ups begin shortly after 6:00 am on a typical morning and last until almost 11:00 am. The length of the back-up reaches over 20 miles around 8:30, but is still 10 miles in length at 10:00 am. This means that if you choose to travel I-95 at 10:00 am on a weekday morning, you should expect to encounter stop-and-go conditions in at least 10 miles of the corridor.

As seen in Figure xx, traffic back-ups begin shortly after 6:00 am on a typical morning and last until almost 11:00 am. The length of the back-up reaches over 20 miles around 8:30, but is still 10 miles in length at 10:00 am. This means that if you choose to travel I-95 at 10:00 am on a weekday morning, you should expect to encounter stop-and-go conditions in at least 10 miles of the corridor.

The extent and duration of such severe congestion (stop-and-go conditions) makes it very difficult for commuters to reach jobs, for residents to conduct normal household travel such as trips to medical appointments, and for companies to conduct normal business activities.

Such severe congestion currently exists primarily in the Bridgeport-Stamford area, but its impact is felt throughout all of Connecticut. As the state's primary link to New York markets, economy, and transportation hubs, congestion in the I-95 corridor reduces the entire state's access to this global economic and transportation center. Gallis noted that severe congestion was not only restricting the Bridgeport-Stamford area's ability to grow, it was also restricting the ability to grow the economy in the New Haven-Hartford-Springfield economic region and in the Southeastern CT economic region. I-95 corridor congestion threatens to choke off economic growth throughout the state.

Importance of Transportation Investment to Economic Growth

Gallis and others have clearly demonstrated how transportation infrastructure supports economic growth. However, quantifying its impact is difficult and not often done. The difficulty derives from the number of variables that affect economic growth and the complexity of their interactions. It is further complicated by the fact that while good transportation is a *necessary* condition for economic growth, it is not *sufficient* by itself. Other market forces must be strong enough for growth to occur. For example, a good transport system will not assure growth in Connecticut if the national economy is in recession.

The economic benefits of the transportation investments proposed in this report are not quantified. However, insight to how they will facilitate economic growth can be gained from a special study done by the CT Department of Economic and Community Development (DECD) for I-84 in Waterbury. This study was unusual in two ways. First, it was a collaboration between DECD and the CT Department of Transportation (DOT) to evaluate a transportation problem.

Second, DECD employed an unusual combination of economic models and transportation models to provide an assessment of the economic growth effects of a transportation improvement. This special modeling is rarely done on transportation projects, so it serves as an instructive case study of how transportation improvements can support economic growth.

Case Study: I-84 Viaduct in Waterbury. The DECD analysis was done as part of a larger study by Department of Transportation (DOT) of options for replacing the aging elevated section of I-84 through Waterbury, which includes an interchange with Route 8. The project goals are to replace an aging viaduct, eliminate the safety problems associated with the Route 8 interchange, reduce congestion by adding a third lane, and provide redevelopment opportunities in Waterbury.

The DECD analysis determined that replacing the viaduct with a new viaduct that is safer, reduces congestion, and offers more opportunities for development could facilitate significant economic growth. They estimated the state economy could grow by as much as 9,300 jobs and \$1.1 billion in annual economic output.

Economic growth
9,300 jobs annually
\$1.1 billion annually

Business Perspectives on Transportation Investment. The importance of transportation investment to economic growth is also recognized by business leaders in the state. In surveys of businesses in different regions of the state, the CBIA found the support for transportation investment almost universal. Fairfield County businesses expressed the strongest support with 96% of business leaders surveyed responding that “modernizing the current transportation infrastructure somewhat or extremely important to the region’s economic growth. Similar but slightly lower levels of support were found in all regions surveyed.

While support for transportation investment is almost universal, the reasons for the support differ by region. Fairfield County businesses are most concerned about congestion and its impact on access to New York. As expressed in the survey report:

“Fairfield County’s proximity to the financial capital of the world is relevant only if residents, employees, clients, products, investors, and service providers are mobile and accessible. Even in a global marketplace connected as much by the Internet as by interstates, reliable access to customers and workers is essential. Record growth in Metro North Commuter Railroad ridership (both in-state and out-of-state) is evidence of the importance of geographic connectivity even in a technologically linked society and economy.” Fairfield County Business Survey, CBIA, 2009, p. 7

This quote from the 2009 survey report highlights one way in which some economic growth in the I-95 corridor was continued even as congestion brought traffic on I-95 and the Merritt Parkway to a crawl. While highway capacity was exhausted, capacity still existed on Connecticut’s New Haven Line. With frequent service throughout the business day and well into the evening, the New Haven Line rail service was able to support some business growth in the corridor that would not have been possible otherwise. Businesses and commuters turned to rail options as highway access and mobility was restricted.

New Haven Line
service helped sustain
economic growth.

In other parts of the state the reasons for support for transportation investment reflects the nature of the respective regional economies as well as the status of the regional transportation systems.

For example, in Southeastern CT congestion is not a major concern, but good transportation links are considered important to supporting and growing the area's tourism industry. In the Hartford-Springfield region, congestion is an important reason for supporting transportation investment, but so is the perceived need for more transit service.

II. The Challenge of Preserving Our Transportation Infrastructure

Connecticut faces an enormous infrastructure preservation challenge. Our highway and transit systems are some of the most intensely used in the country, but our infrastructure is among the oldest and is subject to some of the harshest weather conditions. Maintaining what we have under such intense use and demanding conditions is straining our financial resources. Over the last three decades we were able to make progress toward improving the state of repair of our assets, but that progress has largely ceased, and in some cases begun to reverse itself. This section provides an overview of the challenge of maintaining our infrastructure, our level of need, and future trends.

Operating and maintaining a transportation infrastructure as large and complex as Connecticut's is a difficult and expensive task. The state owns approximately 3700 miles of highways, 3900 highway bridges, 230 miles of rail track, 200 railroad bridges, 270 rail cars, 650 buses, 6 airports, a state pier, two ferries, and numerous buildings such transit stations, highway garages, and highway rest stops. In addition to the state-owned facilities, our cities and towns own and maintain an extensive system. Although less traveled, the 17,265 miles of local roads and 1,241 local bridges are an important part of our entire network.

Connecticut's coastal environment poses challenges that often require expensive solutions. Both highway and rail networks require more bridges – and often specialized bridges. Rail bridges over 'navigable' waterways pose a special challenge.. Often, the only viable solution is a 'movable' bridge that can be raised or swung out of the way when a boat needs to pass. Movable rail bridges are expensive to build, maintain, and operate. DOT owns six of these movable rail bridges and five of them are over 100 years. This means much of our state commerce is dependent on the safe and reliable operation of 100-year old bridges. For example, if the New Haven Line's moveable in Westport and Norwalk were to fail to close properly, the New Haven Line would be shut down – and so would a lot of commuters and business activity.

In addition to the size and complexity of our transportation infrastructure, the management of Connecticut's transportation system must account for the extra burden of the very intense use, harsh climate, and advanced age of our highway and rail systems.

Cos Cob draw bridge –movable span DOWN

Cos Cob draw bridge –movable span UP

Walk swing bridge –movable span OPEN

- Many of our freeways serve 100,000 – 170,000 vehicles per day with truck volumes that typically comprise about 10-15 percent of that amount.
- The New Haven Line is one of the nation's busiest rail lines with over 36 million riders per year.
- Harsh winters cause pavements, structures, and vehicles to deteriorate faster. Salt applications and freeze-thaw cycles, cause more rapid deterioration of pavements and structures alike.
- Like many northeastern states our infrastructure is old. The average age of our highway bridges is 50. Five of our major rail bridges are 100 years old.

In summary, Connecticut's transportation system is a large complex multimodal system that is intensely used, but aging and subject to harsh environmental conditions. It has served Connecticut well, but its ability to continue to do so in the future is threatened by increasing demands and reduced resources to maintain and improve it.

Interstate Building Era Poses Special Problem. Our Interstate highway system poses a special problem by virtue of the fact that most of it was built in the 1950s and 1960s. Bridges and structures built in that time period are 40-60 years old and nearing the end of their design life. With so many expensive structures reaching the end of their life span at the same time, we are facing a major financial challenge.

The potential scale of this problem can be seen in Figure xx. It shows the age profile of Connecticut's bridge inventory. Almost half of the bridges were built in the 1950s and 60s as part of the Interstate building surge. They will soon need full reconstruction or replacement. The federal government financed the building of the Interstate system, but is leaving most of the rebuilding to states.

Restoring & Maintaining State of Good Repair

In 2008, CT DOT conducted an assessment of the level of resources needed to maintain, restore, and reconstruct or replace our infrastructure. The total cost of maintaining, restoring, or replacing the state's transportation infrastructure was projected over the next 10 years. The 10-year cost projection was then compared to the estimate of available federal and

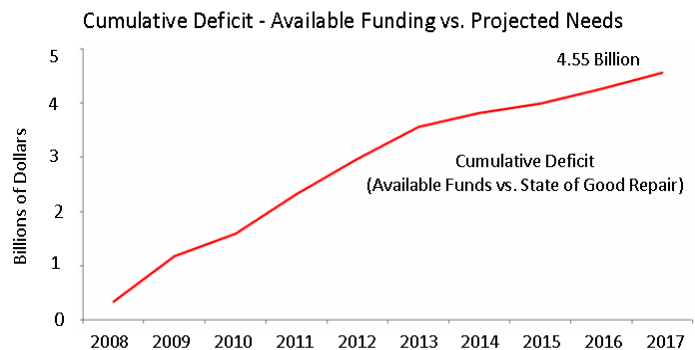

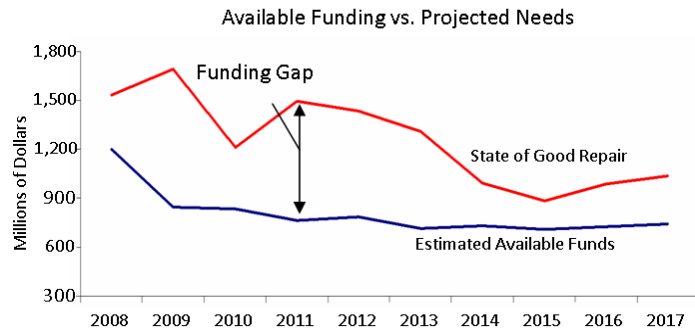

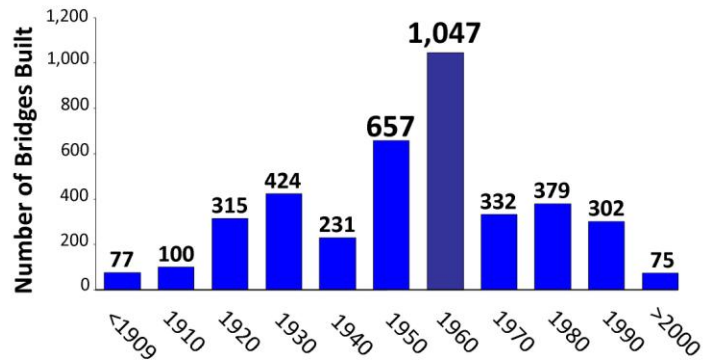

state funds over the 10-year period. This provided a rough estimate of our level of need versus our financial capacity to meet that need.

The conclusion of 2008 assessment is that the cost of the projected 10-year program greatly exceeds anticipated revenues. The analysis is summarized in Figure xx. The lower line in Figure xx represents the anticipated revenue from 2008 through 2017 for transportation projects and programs (highways and public transportation.) The red line represents the projected level of funds needed to preserve existing infrastructure (maintain, repair, reconstruct, and replace). The difference between the two lower lines is termed the **'state of good repair funding gap'** and indicates the anticipated funding shortfall to preserve the existing network.

The state of good repair funding gap shown in Figure xx is a function of two trends. First, projected revenues are expected to decrease in the next few years as bonding capacity in the State Transportation Fund diminishes and as we wind down the 10-year special funding programs authorized by the Legislature in 2005 and 2006. Those two special programs provided an infusion of bonding capacity (\$1.3 billion in 2005 and \$1.0 billion in 2006) that helped reduced some of the backlog of the major capital projects in Connecticut. Second, the maintenance and preservation needs are increasing over the near term. The combination of increasing needs and decreasing revenues creates a gap of \$300 – \$500 million per year that does not diminish significantly until 2013 or 2014.

The cumulative effect of this state of good repair funding gap is illustrated in Figure xx. The line in Figure xx is the cumulative unfunded need for state of good repair improvements. The gap today is about \$2 billion, but it grows to over \$4.5 billion in 2017.

Bridges Built by Decade of Construction

III. The Way Forward: More Funds, More Strategic Investments

The role of the Transportation Strategy Board is to formulate a strategy to improve Connecticut's transportation system. That role was defined for the TSB partly in recognition of the need to broaden state transportation goals to address more than just transportation safety, capacity, and mobility. The TSB's charge was to assure that transportation investments also supported other state strategic goals such as growing a strong economy, promoting sustainable development, and protecting our environment and our quality of life. It is in that spirit that the recommendations presented below are made. We have chosen not to recommend individual projects, but rather to suggest strategic directions that we need to pursue to assure a strong and sustainable future for our state.

Policies to Guide Overall Investment Strategy.

1. *Continue to emphasize more balanced multi-modal approach.* Connecticut has undergone a significant shift in policies and programs from a highway-oriented focus, toward a more balanced multi-modal approach to meeting the mobility needs of residents and businesses. This multi-modal approach needs to continue.

Improve bus service. Bus service is the foundation of Connecticut's transit system, serves a wide variety of functions and geographic areas. In urban markets it is the primary means of commuting to work for transit dependent workers, but also the mode of choice for many suburban residents who use express buses to commute to city centers. In cities with rail service like Stamford, buses and private shuttles expand the reach of rail service by transporting rail passengers to workplaces located beyond walking distance from the train station. Public bus services are also important to the elderly, those with disabilities, and rural residents. CT needs to improve its bus services, and better integrate the many individual systems across the state. Extending the coverage areas, providing connecting services between cities, and providing a more consistent level of service across the state should be a strategic goal.

Improve rail service. Passenger rail service is critical to the future economic health of the NY-New Haven corridor where highway congestion is constraining economic growth and options for highway expansion are limited. Rail is also important to supporting economic growth other areas of the state such as the Route 7 corridor (served by Danbury Branch Line), the Route 8 corridor (served by Waterbury Branch), the New Haven – New London corridor (served by Shore Line East), and the New Haven-Springfield corridor (served by New Haven-Hartford-Springfield service). We need to continue to improve service in these corridors as well as address the major infrastructure preservation needs.

new M-8 rail car

Improve conditions for pedestrian & bicycle travel. Walking and bicycling are important modes of travel in their own right, but they are also important means of accessing rail and bus services. We need to assure that roads are designed and built to accommodate pedestrians and bicyclists, and that our transit systems are easily accessible by pedestrians and bicyclists. DOT has recently shifted its

policies to be more supportive of nonmotorized modes of transport. This new emphasis needs to continue.

Intermodal connections. Multi-modal transportations are much more efficient and effective when there are numerous intermodal connections that provide safe and convenient opportunities to transfer between modes. We need to manage our bus stops, commuter lots, and transit stations to assure they are safe and convenient, and we need to design transit routes and coordinate transit schedules to better connect rail and bus services.

2. **Link transportation to economic growth, sustainable development, & environmental goals.** Connecticut should adopt a transportation planning paradigm that recognizes the importance of linking transportation planning and decision-making to economic growth, sustainable development, environmental, and quality of life goals.

- a. **Develop & integrate economic assessment tools into planning process.** To evaluate the true strategic value of its largest investments, DOT should develop a process for assessing the economic benefits of major transportation projects. The process must be able to assess both the short-term economic impacts (example: construction jobs), and the long-term impacts derived from lower transport costs and improved access to national markets.
 - b. **Consider sustainability, livability, & environment early in planning.** These goals should be considered early in the planning process and prior to the formal environmental assessment.

3. **Develop BDL as important transportation hub & economic resource.** Airports are important facilitators of economic growth, and Bradley plays an important role in linking Connecticut to national economic centers and markets. Connecticut should continue to develop the airport to maximize its economic potential. This includes the development of air passenger and air cargo services, on-airport facilities, and also off-airport development areas.

4. **Develop Freight Capacity in CT & in Northeastern U.S.** Connecticut is not heavily dependent on freight services for transporting CT products out of state. However, it is totally dependent on freight services for supplying consumer goods used by its residents, and for most materials used by CT industries. CT needs to improve the freight infrastructure within state, but it must also collaborate with other states to improve the rail, marine, and pipeline infrastructure in the northeast.
 - a. **Interstate Actions.** CT should collaborate with other northeastern states to develop a strategic plan that identifies critical deficiencies and defines a strategy for addressing them.
 - b. **Intrastate Actions.** Some critical freight needs within CT were defined in previous studies, but relatively little progress has been made to address the needs. CT should allocate funds to begin addressing critical needs of state ports and freight railroads.

Increase the Level of Transportation Investment.

One major conclusion drawn from the Board's review of Connecticut's transportation system, programs, and policies is that we need to substantially increase our level of investment in those systems. Simply stated, current investment levels are not adequate to maintain, let alone improve our transportation system. Without improvements, the existing infrastructure cannot support meaningful economic growth or achieve other strategic goals.

Over the last 10-15 years, transportation infrastructure costs escalated as federal funds lagged and state gas tax revenues dropped. Special state transportation bonding authorizations in 2005 and 2006 offset some of the downward trend with a large (\$2.3 billion). However, they were designed around specific projects and were not intended to be long term financing mechanisms. ***It is essential that we provide sufficient fiscal capacity to support both a program of system preservation that maintains a state of good repair, and a program of system enhancement that allows us to address strategic needs.***

The cost of meeting both system preservation needs and system expansion/enhancement needs is enormous. DOT estimated the cost of unfunded projects in its recent capital plan to be \$15-20 billion over the next two decades. To tackle this challenge, the Board recommends a more robust capital planning process with clear priorities and multi-year cash flow analysis, a carefully structured program of increases to existing revenue sources, and consideration of alternative revenue sources and financing methods.

More Robust Capital Planning Process. Scarce financial resources will be used effectively, if they are allocated to the highest priority projects. This requires a capital planning process that carefully manages the schedule of projects. The process needs to: (1) clearly define priorities, (2) anticipate federal and state revenue streams, and (3) define a schedule of projects that is supported by a financing schedule. It must result in long-term capital plan that identifies and prioritizes projects. This will assure funding for higher priority projects, while identifying lower priority projects that can be deferred – or if necessary cancelled. The process should build on DOT's recent 5-year capital plan, but it should be refined into a more complete financial planning tool.

Phased Increases in Existing Revenue Sources. While the total cost of unfunded projects is large, the timeframe for planning, designing, and constructing large projects is typically 5-10 years, and the bond repayment period often extends over 20 years. Therefore, the necessary revenue increases can be phased in over 10 years to match the cash flow needs over that period. This approach was used to finance the 1984, 2005 and 2006 transportation initiatives.

The TSB recognizes the importance of keeping our existing infrastructure in a good state of repair. However, in addition to preservation needs, we must expand and enhance our transportation systems to assure that Connecticut remains economically competitive while protecting our environment and fostering sustainable development and livable communities.

The TSB recommends an approach that prioritizes projects in a way that keeps our infrastructure in a good state of repair, but also improves and expands the system to achieve strategic goals. The Board also recommends focusing on 10-year timeframe, and developing a program and schedule of projects financed with revenue increases phased in over the 10-years.

This approach addresses the most critical needs. However, additional funding will be needed in the long term since not all capital needs can be met in the first 10 years.

The Transportation Strategy Board recommends that funding be provided to address three distinct and important categories of need. They are: (a) programmatic preservation funds, (b) major preservation projects of strategic importance, and (c) major system enhancement projects of strategic importance. The proposed program consists of the following elements.

1. **Programmatic Preservation Funds.** (\$1.5 billion in years 1-10)
2. **Major Preservation Projects of Strategic Importance** (\$3 billion in years 1-10)
3. **Major Enhancement Projects of Strategic Importance** (\$3 billion in years 1-10)

Category 1: PROGRAMMATIC PRESERVATION FUNDS.

Connecticut has a backlog of highway and transit preservation needs that must be addressed. Without additional funding, the backlog will grow and likely accelerate since much of our Interstate system was built in the 1950s and 1960s and is now reaching the end of its normal design life.

Stable Source of Annual Funding. To address the problem, the state needs a consistent and stable source of funding that is available on an annual basis. Predictable funding is essential to developing a cost-effective program of basic preservation projects.

\$1.5 Billion in Years 1-10. It is estimated that the state needs about \$300 million annually for a basic transit and highway preservation program. If the increases are phased in over 10 years, the 10-year cost will be \$1.5 billion. This will allow the state to repave or reconstruct 350 miles of road annually, and restore **XX-XX** bridges annually. It will also establish a transit preservation program for track repair, equipment overhauls, and station maintenance.

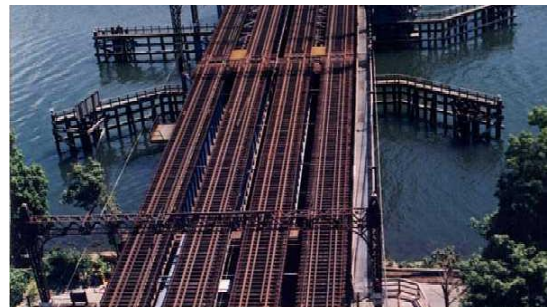

Category 2: MAJOR PRESERVATION PROJECTS OF STRATEGIC IMPORTANCE.

Some preservation projects have value beyond simply repairing a piece of infrastructure. Some are of strategic value because the function performed by the individual piece of infrastructure is so critical that it cannot be allowed to fail or become inoperative. Other preservation projects have added value because they enhance system performance or support strategic goals such as economic growth and making communities more livable.

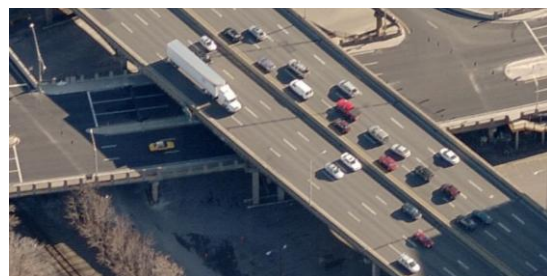

The first type of strategically important preservation projects includes major bridge replacements such as the Walk, Saga, Devon, and Cos Cob rail bridges on the New Haven Line. These movable bridges are over 100 years old. Should any of these bridges stop functioning, train service would be halted for tens of thousands of commuters. This would add to congestion on I-95, disrupt businesses, and affect the economy.

The second category includes highway 'reconstruction' projects that also include some performance improvement or other enhancement. It is sometimes difficult to categorize a project as primarily preservation or primarily enhancement. The key determinant in defining these as preservation is that the facility is beyond its design life and needs to be fully reconstructed or replaced. When considering how to replace these major facilities, it is prudent to address the system enhancement needs and opportunities at the same time.

Saga rail bridge, Westport

I-84 viaduct, Hartford

Two examples are: (1) the I-84 viaduct in Hartford, and (2) the I-84 viaduct in Waterbury. The latter includes the I-84/Route 8 interchange. Both viaducts are about 50 years old and need to be replaced. However, replacements would not be done without addressing safety and congestion problems. Replacing the viaducts also presents an opportunity to enhance economic development and improve quality of life in adjacent neighborhoods and the affected cities.

\$3 Billion in Years 1-10. The estimated cost of addressing our most critical preservation needs is about \$7 billion, but only \$3 billion is needed over the next ten years. The balance of the program would extend into a second decade.

Category 3: MAJOR SYSTEM ENHANCEMENT PROJECTS.

There are some large projects identified through previous studies that are needed to expand system capacity or enhance performance. Examples of these strategically important projects include: the widening of I-84 from NY to Waterbury, reconfiguring the Route 15/Route 7 interchange in Norwalk, improving the Waterbury Branch Line, and improving the New Haven-Hartford-Springfield rail line.

\$3 Billion in Years 1-10. The estimated cost of addressing our most critical preservation needs is about \$9 billion, but only \$3 billion is needed over the next ten years. The balance of the program would extend into a second decade.

Strategically Important Corridors

The strategic importance of a project or program derives *in part* from the importance of the travel corridor it serves. There are some transportation corridors that are of special importance because they serve as conduits of travel and commerce to large areas of the state. They serve both the needs of the corridor itself as well as the needs of areas outside the corridor. Given the State's limited fiscal resources, the strategic importance of a corridor should be one of the factors considered when allocating limited funding.

Considering their role in linking Connecticut to national transportation networks and major economic centers, the two most important corridors are NY-New Haven and NY-Danbury-Waterbury-Hartford. Both corridors provide critical access to NYC and most of the national transportation network outside New England. Three other corridors that serve to connect Connecticut to other states and economic centers are New Haven-Hartford-Springfield, New Haven-New London-RI, Hartford-Sturbridge. While other corridors serve important regional functions, these five serve important statewide functions.

Assigning priority to corridors of statewide importance does not mean the needs in other regionally important corridors such as Route 7, Route 8, Route 9, and I-395 can be ignored. In some cases, individual needs in these corridors might equal or exceed some of the needs in higher priority corridors. Corridor priority should not be viewed as prerequisite for funding, but rather as one of several factors considered during funding decisions.

IV. Fiscal Challenges & Options

Advancing an expanded transportation agenda represents a major financial challenge for the State. Significant additional revenues will be required in the short and long term in order to address the pressing transportation capital needs outlined in this paper.

There are numerous potential options for making more funding available to support new transportation investments in Connecticut. However, they vary substantially in regard to their revenue potential, who they impact, and public acceptability. In addition, some will impact other parts of the State budget. Identified below are ones that have the best potential to generate a relatively large revenue increase. Also included is a brief discussion of federal funding sources.

Increase Gasoline Tax (yield: \$15-200M per year). The current state gas tax is 25 cents per gallon and yields about \$375 million per year. Every 1-cent increase in the gasoline tax will yield another \$14-15 million per year. To raise an additional \$100 million per year would require an increase of about 7 cents per gallon.⁵ Restoring the previous 14-cent cut in the gas tax would raise about \$200 million.

The advantage of the gas tax is that it is relatively stable in terms of year-to-year fluctuations. The disadvantage is that the volume of gasoline sold is growing very slowly, and could decline in response to market forces, travel choices, and federal fuel efficiency standards. These forces are expected to gradually shift the mix of vehicles in Connecticut to a much higher proportion of fuel-efficient vehicles or alternate fuel vehicles such as electric vehicles. A more fuel-efficient fleet will reduce consumption of motor fuels and revenues from the gas tax.

Transfer Petroleum Gross Receipts Tax to STF (yield: about \$120M per year). The petroleum gross receipts tax (GRT) is a tax on petroleum wholesalers that is deposited into the state General Fund rather than the STF. The current tax rate is 7.0 percent and is projected to yield about \$285 million in FY 2012. Of that amount, \$165 will be transferred to the STF to pay bonds on projects funded through the 2005 and 2006 transportation acts. The transfer of \$165 to the STF leaves about \$120 million in the General Fund. If all the GRT revenues were dedicated to or transferred the STF, it would make an extra \$120 million available for transportation investments annually.

The disadvantage of the GRT is its volatility. It is based on the 'price' of petroleum as well as the volume of petroleum sold. Since it is tied to the price of gas, tax receipts fluctuate with every fluctuation in the highly volatile petroleum market. Because a major purpose of the STF is to pay debt service on transportation bond, that volatility may concern the investment community.

Increase Petroleum Gross Receipts Tax. (yield: \$19-38M per year). In addition to transferring GRT revenues to the STF, the GRT tax rate could be increased to generate higher revenues. If the current rate of 7.0% were increased to 7.5%, it could generate an extra \$19 million per year. It should be noted that the rate is already scheduled to rise to 8.1% effective 7/1/2013. The latter will raise about \$38 million per year.

Transfer Sales Tax on Cars & Car Parts to STF (yield: \$300M per year). The current 6 percent tax on the sale of cars and car parts raises about \$300 million per year. All of these revenues go to the state's general fund rather than the STF. All or part of the revenues could be transferred to the STF.

⁵ Diesel tax is separate and calculated on an annual basis by the Commissioner of the Dept. of Revenue Services. The diesel tax rate effective July 1, 2010 is 39.6 cents per gallon. Every 1-cent increase in the diesel tax will yield approximately \$2.8 million per year

Summary Table of Alternate Revenue Sources

	Revenue Source	Revenue potential (annual)	Explanation
1	<i>Increase gas tax</i>	\$15-\$200M	Each penny per gallon of gas tax raises \$14-\$15 million annually
2	<i>Transfer all gross receipts taxes (GRT) to STF</i>	\$120M	Currently about \$120 million per year of GRT revenues are <u>not</u> transferred to STF from General Fund.
3	<i>Increase gross receipts tax (GRT)</i>	\$19-\$38M	Increase GRT & transfer increase to STF. Each increase of one-half a percentage point raises \$19M annually)
4	<i>Transfer all car sales taxes to STF</i>	\$300M	Currently sales tax on cars sold thru dealers raises \$xxx-\$xxx annually & goes into General Fund.
5	<i>Possible increases in federal formula funds</i>	\$5-\$100M	Annual increases are typically small (assume 1% or \$6M). Next authorization bill might provide some additional increase (assume 15% or \$100M)

Project-based or project-specific funding:

6	<i>Possible new federal discretionary funds</i>	unknown	Next authorization bill might shift funding to a more discretionary or competitive basis. Additional funding for CT possible for certain projects, but projects must be eligible and competitive.
7	<i>Finance major projects with electronic tolls</i>	\$25-\$75M	"Electronic" tolling could finance most of the cost of large individual projects. Tolls on a major bridge or short section of freeway could raise \$25-\$75M annually to pay off construction bonds for that project.

Possible Increases in Federal Formula Funds (yield: \$6-\$100M per year). Connecticut currently receives about \$650 million annually in federal transportation funds. Almost all of it is through regular federal formula-based funding programs. Annual increases are typically small (1-2%). Federal programs are reauthorized every 5-6 years and can provide larger increases. However, given federal gas receipts and recent Congressional legislative trends, it is unlikely that Connecticut would realize a major increase. Assume 15 percent or \$100 million increase.

Possible Increase in Federal Discretionary Funds (yield: unknown) Future federal transportation programs are likely to include more discretionary or competitive funding. Connecticut could realize an increase in funding through discretionary programs under two conditions: (1) it aggressively pursues discretionary funding and develops the grant writing capabilities required, and (2) if the discretionary programs are focused on the type of infrastructure problems and transportations systems that Connecticut needs to address.

Finance Major Projects with "Electronic" Tolling (yield: \$25-75M per project per yr). Connecticut has been reluctant to reinstitute tolling due to safety, congestion, and air quality problems associated with the system of tolling and toll booths it abandoned over 20 years ago. New systems of 'all electronic' tolling eliminate those problems and might offer a viable method for financing some of our largest and most expensive infrastructure projects. Not every project is a good candidate for such project-specific tolling. For good candidates, it offers an alternate funding mechanism that has been successful in other states both in terms of revenue generation and public acceptance.

Mega-projects such as the replacement of the I-84 viaduct in Waterbury (including the I-84/Rt8 interchange) can cost \$2-3 billion to build. The enormous cost of these projects makes it almost impossible to finance even one of them given Connecticut's current federal and state revenue streams. However, instituting electronic tolls within the project area could generate \$50-\$75 million annually. This would be enough to finance most of the project cost with toll revenue. Besides replacing an old and deteriorating highway structure, this project would greatly improve safety, eliminate a major traffic bottleneck, and spur economic growth in the region and state.
